Explanatory Note

The series embodies results of investigations, usually of restricted scope, intended to aid or direct management or utilization practices and as guides for administrative or legislative action. It is issued in limited quantities for the official use of Federal, State or cooperating Agencies and in processed form for economy and to avoid delay in publication.

United States Department of the Inter-

An announcement (which read as follows) was recently issued by the Bursau of Commercial Fisheries Biological Laboratory, Honolulu, concerning an error in depths of reversal computed from the readings of unprotected and protected reversing thermometers;

"Recently, it was discovered that the depths of reversal of the Nansen bottles, as calculated at the Honolulu Biological Laboratory from temperature differences of unprotected and protected reversing thermometers, are in error. These depths, which are in excess of the thermometers, are in error there are in error to the proper value by the use of a correct depth, may be reduced to the proper value by the use of a correction factor, as described below.

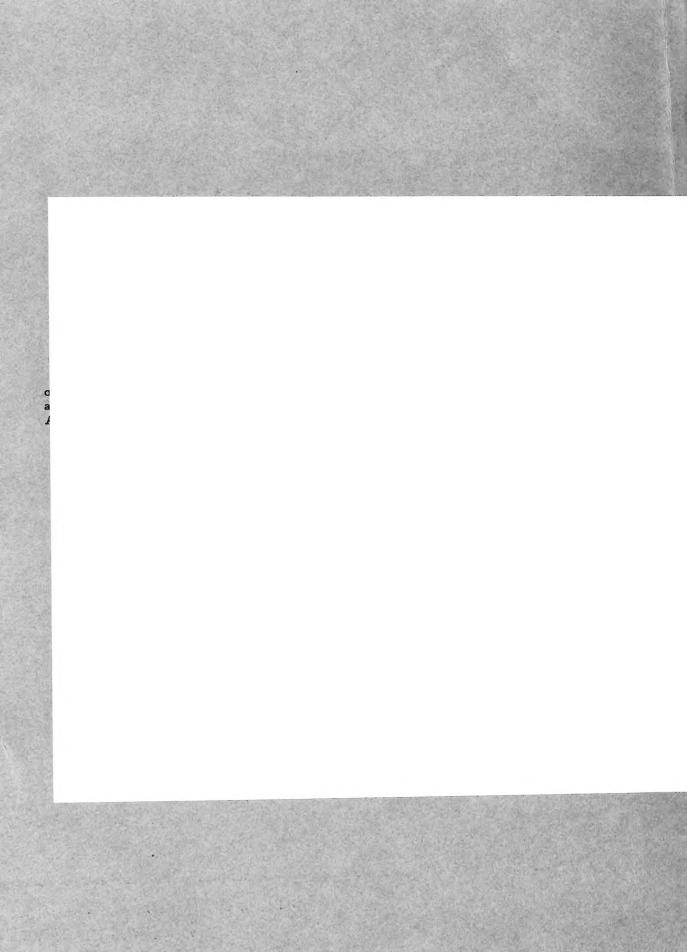

Was being established, a table of the factor $1/(Q\times P_m)$ was prepared for use in computing the depths of reversal from the readings of unprotected thermometers; Q represents the pressure-constant of an unprotected thermometer, and P represents the mean density of the water column above mometer, and P represents the mean density of the water column above the depth of thermometer reversal, which was taken to be 1,0303 in all the depth of coccurred in the calculation such that, instead of cases. An error occurred in the calculation such that, instead of $1/(Q\times P_m)$, the table consisted of values of $1/(Q\times P_m)$. This error is $1/(Q\times P_m)$, the table consisted which have been published by this laboratory under its previous name, Pacific Oceanic Fishery Investigations, ratory under its previous name, Honolulu Biological Laboratory, up to and and under its present name, Honolulu Biological Laboratory, up to and including 1960. Therefore, in making use of the data published by this including 1960. Therefore, in making use of the data published by this aboratory before 1961, all depths should be corrected by dividing each laboratory before 1961, all depths should be corrected by dividing each by $(P_m)^2$, which is equal to 1.0615. Multiplication of all the published by 0.942 will give the proper value for the depth of each observation.

Subsequent analyses have shown that the error described above is present only in the data from those cruises made by vessels of the Bureau of the data from those cruises made by vessels of the Bureau of the data from those cruises made by vessels of the Bureau of the data from those cruises and by vessels of the Bureau of the data from those cruises are data from those cruises for which data containing this cruise 20 (February-April 1953). Cruises for which data containing this error have been published are listed below with the appropriate publication references.

Special Scientific Report -- Fisheries No. 217

WASHINGTON: MAY 1957

ABSTRACT

In the late summer (August-October) of 1956, two research vessels from POFI cooperated with those of three other organizations in a quasi-synoptic oceanwide survey of the Pacific Ocean. Operating in the area of the Marquesas Islands, the Hugh M. Smith made detailed physical, chemical, and biological observations in order to define features of oceanic circulation and to obtain information on the abundance and distribution of plant and animal life. Also operating in that area, the Charles H. Gilbert sought to evaluate the tuna resources by longline and live-bait fishing, by trolling, and by observation of fish schools and bird flocks. Data thus obtained are presented here with a description of the field and laboratory procedures involved.

SUMMARY, OCEANOGRAPHIC AND BIOLOGICAL DATA, MARQUESAS ISLANDS AREA, AUGUST-SEPTEMBER, 1956 (EQUAPAC)

By

Thomas S. Austin, Oceanographer
Pacific Oceanic Fishery Investigations
U. S. Fish and Wildlife Service
Honolulu, T. H.

In recent years a number of descriptive and theoretical papers have been published, each describing various sectors of the Pacific equatorial circulation. The need for a multiplevessel, quasi-synoptic, oceanwide survey of the area became apparent. A formal plan for such a survey, named EQUAPAC, was adopted in February 1956 at a conference in Honolulu. The Japanese Hydrographic Office and the Pacific Oceanic Fishery Investigations (POFI) of the U. S. Fish and Wildlife Service were designated as coordinating agencies. Participating vessels included those from various Japanese oceanographic and fishery laboratories, the French Oceanographic Institute at Noumea, the Scripps Institution of Oceanography, and POFI. The tracks of the various vessels are shown in the frontispiece of this report.

POFI assigned two vessels to EQUAPAC, the Hugh M. Smith for the oceanographic and the Charles H. Gilbert for the fishing surveys. The multiple-vessel expedition was fortunately timed so that POFI's participation could be considered as a part of an already scheduled program in the Marquesas-Tuamotus area. the data from the Smith and the Gilbert may be evaluated both with reference to the data collected simultaneously by other vessels during EQUAPAC and also with reference to data which will be collected in other seasons by our own ships in the Marquesas-Tuamotus area. The oceanographic and biological data collected from the Smith and the Gilbert are presented in this report, along with a brief narrative text and descriptions of the variations from the routine POFI field and laboratory techniques reviewed in earlier reports.

The Smith departed Honolulu on August 7, 1956 occupied oceanographic stations as shown in figure 1, and returned to Honolulu on October 5, 1956. The Gilbert departed Honolulu on August 6, 1956, conducted fishing and baiting operations at the positions shown in figures 2 and 3, and returned to Honolulu on September 26, 1956.

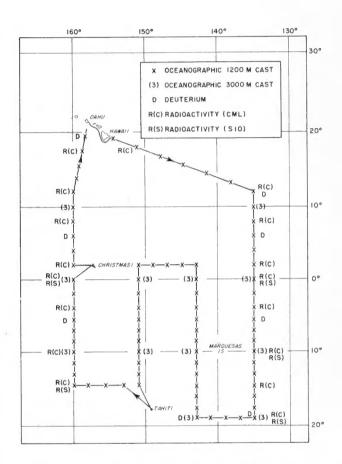

Figure 1.--Track chart showing observations conducted during Hugh M. Smith cruise 35 (EQUAPAC), August 1 - October 5, 1956.

The primary missions of the Smith were to conduct detailed chemical, physical, and biological observations in order to delineate the gross, oceanic circulation features and obtain information on the variations in abundance and distribution of the biotain respect to the environment. The program for the Gilbert was designed to evaluate the tuna resources, principally in the area around the Marquesas, by longline and live-bait fishing, by trolling, and by visual observations of fish schools and

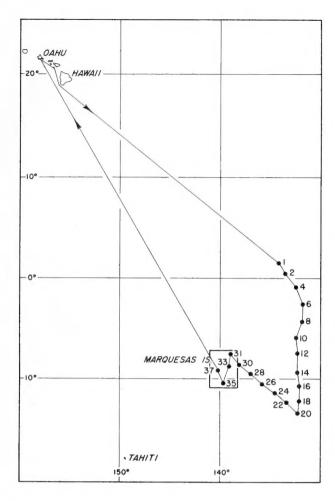

Figure 2.--Positions of longline stations occupied by the Charles H. Gilbert cruise 30, August 6 - September 26, 1956.

accompanying bird flocks. In addition to these primary missions, the Gilbert conducted bait surveys around the Marquesas Islands, returning to Honolulu with 21 buckets of Marquesan sardines (Harengula vittata) for introduction into Hawaiian waters. The Smith returned with a load of potential game fish (1658 specimens) from the island of Moorea, Society Islands, for similar introduction into Hawaiian waters; the latter project being conducted by the Territorial Division of Fish and Game.

FIELD PROCEDURES

Oceanography and Meteorology

The Smith occupied a total of 79 oceanographic stations; 67 of these were to 1200 meters' depth and 12 were to 3000 meters. The position of each station is shown in figure 1. Nansen bottle spacing in the upper 200 meters was determined by the character of the

bathythermograph trace obtained just prior to occupying a station. Thirteen bottles were used in the 1200-meter casts. On the 3000-meter stations two casts were made, one from the surface to 800 meters (10 bottles), the other from 600 to 3000 meters (7 bottles).

Water samples for oxygen, salinity, and inorganic phosphate determinations were drawn from each bottle. The oxygen samples were analyzed on board using the modified Winkler method; the phosphate (frozen) and chloride samples were returned to the laboratory at Honolulu for analyses.

Samples for radioactivity determinations were obtained at the surface and 500 meters at the stations indicated on figure 1. At each of these stations, a 15-to 20-minute phytoplankton tow was taken using a Clarke-Bumpus sampler. Water and phytoplankton samples, as appropriate, were shipped to the Central Meteorological Laboratory, Tokyo, Japan, and to the Scripps Institution of Oceanography, La Jolla, California, for analyses.

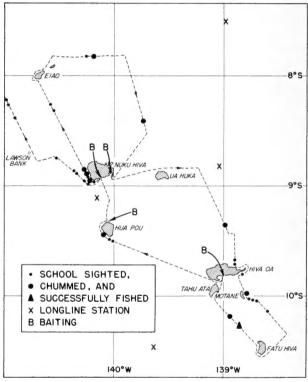

Figure 3.--Track chart for Charles H. Gilbert cruise 30 in the vicinity of the Marquesas Islands showing positions of longline stations, area of scouting and live-bait fishing, and positions of baiting sites.

Samples for analysis of deuterium were taken at stations as indicated on figure 1. These samples were forwarded to Dr. Irving Friedman, U. S. Geological Survey, Washington, D. C., for analyses.

On both vessels the standard weather observations were recorded at the position of each BT. These data, along with the other data normally recorded with each BT lowering, are listed in tables 1 and 2. In addition, the Smith recorded weather observations at 0000, 0600, 1200, and 1800 GCT daily; the Gilbert at 0600 and 1800 GCT. These data, recorded on USWB Form 1210-F, are listed in tables 3 and 4.

During the cruise, a total of 460 BT observations were made from the Smith; lowerings were made at about 15 minutes before arrival at an oceanographic station, at messenger time or just after station, and at 3-hour intervals between stations. The Gilbert made a total of 243 lowerings with one every 3 hours during the runs between Honolulu and the Marquesas and return, three during each longline station, and four each day in the Marquesan area while scouting and live-bait fishing. On the Gilbert, chloride and phosphate samples were obtained once each day, in conjunction with a BT lowering, on all runs except between 5°N. and 5°S. latitude, where they were taken with every other BT, and the resulting data are included in table 2. The recording thermograph was operated continuously on both vessels while underway.

The <u>Gilbert</u> made Secchi disc lowerings and water color determinations (Forel scale) each day at noon whenever weather conditions were suitable (table 5).

Carbon Fixation

The rate of primary productivity was measured in a total of 106 samples by using the carbon isotope (C¹4) method as developed by Steemann Nielsen (1952) and modified by Doty (King et al., 1957). The samples were collected and processed aboard the Smith by M. Angot, collaborator from the Institut Francais D'Oceanie, New Caledonia. The program was carried out in cooperation with the University of Hawaii.

Zooplankton

South of 12°N. latitude, the Smith made a total of 40 two-net, oblique tows employing on each haul a 1-meter net of 656 Nitex (apertures 0.66 mm. in width) and a 45-cm. net of 308 Nitex (apertures 0.31 mm. in width), the two

nets being towed simultaneously from a single wire. These tows were made each night starting at 2100 hours. The 40-minute, oblique, 1-meter net tow, to a depth of about 200 meters, was essentially the standard POFI tow as described by King and Demond (1953). The 30-minute, oblique, 45-cm. net tow to a depth of about 150 meters was adopted as standard for all participants in EQUAPAC at a conference held in Honolulu during February, 1956.

In addition to the above night-time tows, a total of 23 oblique 1-meter net hauls to 200-225 meters were made from the Smith during daylight hours.

The depths at which the nets sampled were estimated by utilizing wire angle and length of wire out. These data were recorded every 2 minutes and the depth determined therefrom on the assumption that the towing wire described a straight line (King and Demond 1953).

During daylight hours while patrolling the longline (see fig. 2 for positions of longline stations), the Gilbert made a total of 19 halfhour, single-net surface tows using a 1-meter net of 656 Nitex. Fifteen half-hour tows were made each night with two nets fishing simultaneously. In addition, in order to examine statistically the variability related to the hauling method, one double-net, half-hour tow and one single-net, 1-hour tow were made as time permitted. The primary purpose of this sampling on the Gilbert was to evaluate these different methods for collecting tuna larvae. As these tows also provided a measure of the standing crop of zooplankton in the surface waters, the resulting data are included in table 19 of this report.

Midwater Trawl

The Smith made 35 1-hour hauls from the surface to approximately 200 meters using the modified, 10-foot Isaacs-Kidd trawl (Devereaux and Winsett 1953). These hauls were made at 2000-2100 hours each evening, just before the plankton tows. A description of the net and hauling method is given by King, et al. (1957).

Bait Surveys and Fishing

Bait surveys and tuna fishing, the latter by longline, trolling and live bait, were conducted primarily from the Gilbert. The Smith performed trolling, incidental to the primary mission with two lines during daylight hours at an average speed of 9 knots. The Gilbert, as a part of her primary mission, trolled during daylight hours using 6 lines at speeds of from 6-8 knots. The common and scientific names for each species of fish caught from either the Gilbert or the Smith are listed in table 6. The trolling catch of the Smith is listed in table 7; that of the Gilbert in table 8. Both vessels maintained a standard wheel watch for birds, fish, and aquatic mammals; the results of these observations are given in tables 9 to 12.

The Gilbert fished 10 tuna schools by live-bait, pole-and-line methods, trolled a total of 424 line-hours by direct trolling at vessel speeds between 6.4 and 9.8 knots, and fished a total of 20 longline stations. Sixty baskets of 11-hook gear were used at each longline station. The position of each station is shown in figures 2 and 3; the catch results are summarized in tables 13 and 14. The catch statistics for the pole-and-line fishing are given in table 15. A more complete report describing the Gilbert's fishing methods and results will be published in the near future.

At 7 baiting stations located at positions shown in figure 3, a total of 235 buckets of Marquesan sardines (Harengula vittata) and 8 of goat fish (Upeneus parvus) were captured. The catch at each station is listed in table 16. A detailed report on the distribution and abundance of bait in the Marquesas Islands will be prepared following the January-March 1957 cruise of the Gilbert to this area.

Miscellaneous

The EDO depth recorder was used on both vessels to study the deep scattering layer. The Gilbert obtained soundings at various positions in the area of the Marquesas Islands.

The Hardy Continuous Plankton Recorder was towed by the <u>Gilbert</u> for five days (1,187 miles) from Lawson Bank, Marquesas (see fig. 3) to 8°30'N., 150°19'W. The recorder became inoperative during the fifth day of continuous towing.

The Gilbert field party arranged for POFI to obtain copies of the records from the weather stations on Nuku Hiva and Hiva Oa and for a Marquesan weather observer to take weekly sea surface temperatures and salinity samples. The Smith field party serviced the weather instruments at the Christmas Island station.

The Gilbert made night-light collections near the islands of Eiao and Hiva Oa (see fig. 3).

LABORATORY PROCEDURES

Oceanographic Processing

The salinity samples were analyzed by Fajans' modification of the Mohr method (Van Landingham 1957). The phosphate samples were analyzed by the hydrazine sulphate modification of Denige's method (King et al. 1957). Stations 1 to 6 were deleted when samples were contaminated by brine solution during freezing. After station 6 all samples were dry frozen. An accident in the laboratory contaminated stations 14, 17 and 25. Stations 35, 55, 62 and 66 were deleted as examinations indicated they were erroneous. It should be pointed out that further analysis may necessitate additional station deletions. As previously mentioned, the dissolved oxygen analyses were completed aboard the Smith.

The oceanographic station data were processed with the techniques described by Montgomery (1954), Montgomery and Wooster (1954), Stroup (1954), and King et al. (1957). The observed data from each station are listed in table 17; the station curves are reproduced in figure 4.

Carbon Fixation Measurements

A detailed description of laboratory procedures for the determination of the quantity of C¹⁴ photosynthetically fixed per unit of time, and the associated calculations has been given by King et al. (1957). The counting, done with a Tracerlab SC16 windowless gas flow counter and a Tracerlab 1000-Scaler of a Nuclear Chicago 161A-Scaler, was performed at the University of Hawaii under the supervision of M. S. Doty. The results of the C¹⁴ measurements are given in table 18.

Zooplankton Samples

The displacement volumes of the plankton from the oblique tows made by the Smith and the surface tows made by the Gilbert are given in tables 19 and 20. These volumes were determined after removing all fish eggs and larvae as well as all "jellies" greater than 2 cm. in length. The details of the method are described by Hida and King (1955).

The flowmeter used with the 45-cm. net recorded to 10,000 revolutions and then repeated the cycle. The upper limit of 10,000 was sometimes exceeded during the 30-minute oblique tows; thus it was necessary to calibrate the flowmeter in the 45-cm. net against that in the 1-meter net. The resultant correction factors

were used in determining the volumes shown in table 19.

Midwater Trawl Samples

The volumes and group counts of the organisms captured in the midwater trawl hauls made during EQUAPAC will be published in a later report.

Fishing Data

No special methods or techniques were used during the preparation of the fishing data included in this report.

 $[\]frac{1}{2}$ Sea state coded according to Oceanographic Log Sheet B, PRNC-NHO-1189 (Rev. 2-56).

 $[\]frac{2}{2}$ Wind speed in knots.

Table 6. -- Common and scientific names of fish taken on EQUAPAC

Yellowfin tuna Neothunnus macropterus (Temminck and Schlegel)

Bigeye tuna Parathunnus sibi (Temminck and Schlegel)

Albacore

Skipjack

Little tunny

Dogtooth tuna

Dolphin

Broadbill swordfish

Germo alalunga (Bonnaterre)

Katsuwonus pelamis (Linnaeus)

Euthynnus yaito Kishinouye

Gymnosarda nuda (Günther)

Coryphaena hippurus Linnaeus

Xiphias gladius Linnaeus

Shortnosed spearfish Tetrapturus angustirostris Tanaka
White marlin Istiompax marlina (Jordan and Hill)

Black marlin Makaira ampla (Poey)

Striped marlin Makaira mitsukurii (Jordan and Snyder)

Wahoo Acanthocybium solandri (Cuvier and Valenciennes)

Whitetip shark Pterolamiops longimanus (Poey)

Silky shark Eulamia floridanus (Bigelow, Schroeder, and Springer)

Great blue shark

Bigeye thresher shark

Bonito shark

Prionace glauca (Linnaeus)

Alopias superciliosus (Lowe)

Isurus glaucus Müller and Henle

Hammerhead shark

Truncated sunfish

Sphyrna lewini (Griffith)
Ranzania laevis (Gmelin)

Lancet fish Alepisaurus sp.

Puffer Lagocephalus (Linnaeus)

Marquesan sardine Harengula vittata (Cuvier and Valenciennes)

Goatfish Upeneus parvus Poey
Red snapper Lutjanus bohar (Forskål)

Green snapper Aprion virescens Cuvier and Valenciennes

Jack Caranx ignobilis (Forskål)
Jack Caranx lugubris Poey

Jack Caranx melampygus Cuvier and Valenciennes
Barracuda Sphyraena nigripinnis Temminck and Schlegel

Table 7.--Surface troll catch and related data, Hugh M. Smith cruise 35

 $[\]frac{1}{2}$ Bait was chummed on another instance when two yellowfin hit the trolling lines.

Station	Date,	Locality	Number	of sets	Catch of Marquesan sardine, buckets 1/		
Station	1956	Locality	Surround	T	Surround	7.000000	
			net	Lampara	net	Lampara	
38	9/6	Taiohae Bay, Nuku Hiva	9	_	56	_	
40	9/9	*	_	3	3	19	
41	9/9	Houmi, Taipi Vai, Nuku Hiva	1	-	20	_	
47	9/13	Taa Huku, Hiva Oa	1	-	<u>02</u> /	_	
48	9/14	Haka Nai (Aneo Bay), Hua Pou	2	_	0	_	
49	9/14	Taiohae Bay, Nuku Hiva	1	-	72	-	
50	9/16	Taiohae Bay, Nuku Hiva	5	-	72	-	
Total			19	3	220	19	

 $[\]frac{1}{2}$ Most of the catches included small numbers of various reef fishes.

 $[\]frac{2}{2}$ Eight buckets of goatfish were caught at this station.

NOTES ON TABULATED OCEANOGRAPHIC DATA, HMS-35

Where more than one cast was made on a station, they are separated by a horizontal line. The cast number is indicated by a Roman numeral in the margin.

Where the corrected paired protected thermometer readings differed by more than 0.05°C. below 300 m. or more than 0.10°C. above 300 m., both temperature values are tabulated and the depth and salinity are repeated. Delta-t calculated using each temperature value is carried.

Weather is recorded in ww (present weather) code given in the U.S. Weather Bureau Circular M, Eighth Edition, Manual of Marine Meteorological Observations. Cloud coverage is in tenths of sky.

Wind velocity was measured with an anemometer 30 meters above the sea surface. The direction (given to the nearest 10°) is that from which the wind was blowing, measured through 360° from north.

Explanatory Code for Tabulated Data

Q - the value is questionable, but was used in construction of the station curve.

P - the value is poor, and while carried was not used in drawing the station curve.

NG - the value or line is in error and is discarded.

NG(C) - phosphate values in error due to contamination.

NS - this water sample was lost.

PT - Nansen bottle pretripped and data are unusable.
